# KEY CONCEPTS

## 1. Introduction

In this chapter we shall study those points of the domain of a function where its graph changes its direction from upwards to downwards or from downwards to upwards. At such points the derivative of the function, if it exists, is necessarily zero.

## 2. Maximum & Minimum Points

The value of a function  $f(x)$  is said to be maximum at  $x = a$ , if there exists a very small positive number  $h$ , such that

$$f(x) < f(a) \quad \forall x \in (a - h, a + h), \quad x \neq a$$

In this case the point  $x = a$  is called a point of maxima for the function  $f(x)$ .

Similarly, the value of  $f(x)$  is said to the minimum

at  $x = b$ . If there exists a very small positive number,  $h$ , such that

$$f(x) > f(b), \quad \forall x \in (b - h, b + h), \quad x \neq b$$

In this case  $x = b$  is called the point of minima for the function  $f(x)$ .

Hence we find that,

(i)  $x = a$  is a maximum point of  $f(x)$

$$\begin{cases} f(a) - f(a + h) > 0 \\ f(a) - f(a - h) > 0 \end{cases}$$

(ii)  $x = b$  is a minimum point of  $f(x)$

$$\begin{cases} f(b) - f(b + h) < 0 \\ f(b) - f(b - h) < 0 \end{cases}$$

(iii)  $x = c$  is neither a maximum point nor a minimum point

$$\left. \begin{array}{l} f(c) - f(c + h) \\ \text{and} \\ f(c) - f(c - h) > 0 \end{array} \right\} \text{ have opposite signs.}$$

**Note :**

(i) The maximum and minimum points are also known as extreme points.

- (ii) A function may have more than one maximum and minimum points.
- (iii) A maximum value of a function  $f(x)$  in an interval  $[a,b]$  is not necessarily its greatest value in that interval. Similarly, a minimum value may not be the least value of the function. A minimum value may be greater than some maximum value for a function.
- (iv) If a continuous function has only one maximum (minimum) point, then at this point function has its greatest (least) value.
- (v) Monotonic functions do not have extreme points.

**Ex.**  $f(x) = |x|$  has a minimum point at  $x = 0$ . It can be easily observed from its graph.

### 3. Conditions For Maxima & Minima of a Function

**A. Necessary Condition :** A point  $x = a$  is an extreme point of a function  $f(x)$  if  $f'(a) = 0$ , provided  $f'(a)$  exists. Thus if  $f'(a)$  exists, then

$$x = a \text{ is an extreme point} \Rightarrow f'(a) = 0$$

or

$$f'(a) \neq 0 \Rightarrow x = a \text{ is not an extreme point.}$$

But its converse is not true i.e.

$f'(a) = 0$   $x = a$  is an extreme point.

For example if  $f(x) = x^3$ , then  $f'(0) = 0$  but  $x = 0$  is not an extreme point.

**B. Sufficient Condition :**

- (i) The value of the function  $f(x)$  at  $x = a$  is maximum, if  $f'(a) = 0$  and  $f''(a) < 0$ .
- (ii) The value of the function  $f(x)$  at  $x = a$  is minimum if  $f'(a) = 0$  and  $f''(a) > 0$ .

**Note:**

- (i) If  $f'(a) = 0$ ,  $f''(a) = 0$ ,  $f'''(a) \neq 0$  then  $x = a$  is not an extreme point for the function  $f(x)$ .
- (ii) If  $f'(a) = 0$ ,  $f''(a) = 0$ ,  $f'''(a) = 0$  then the sign of  $f^{(iv)}(a)$  will determine the maximum and minimum value of function i.e.  $f(x)$  is maximum, if  $f^{(iv)}(a) < 0$  and minimum if  $f^{(iv)}(a) > 0$ .

### 4. Working Rule For Finding Maxima & Minima

- (I) Find the differential coefficient of  $f(x)$  with respect to  $x$ , i.e.  $f'(x)$  and equate it to zero.
- (ii) Find different real values of  $x$  by solving the equation  $f'(x) = 0$ . Let its roots be  $a, b, c, \dots$
- (iii) Find the value of  $f''(x)$  and substitute the value of  $a, b, c, \dots$  in it and get the sign of  $f''(x)$  for each value of  $x$ .
- (iv) If  $f''(a) < 0$  then the value of  $f(x)$  is maximum at  $x = a$  and if  $f''(a) > 0$  then value of  $f(x)$  will be minimum at  $x = a$ . Similarly by getting the signs of  $f''(x)$  at other points  $b, c, \dots$  we can find the points of maxima and minima.

## 5. Greatest & Least Values of a Function in a Given Functional

If a function  $f(x)$  is defined in an interval  $[a, b]$ , then greatest or least values of this function occurs either at  $x = a$  or  $x = b$  or at those values of  $x$  where  $f'(x) = 0$ .

Remember that a maximum value of the function  $f(x)$  in any interval  $[a, b]$  is not necessarily its greatest value in that interval. Thus greatest value of  $f(x)$  in interval  $[a, b]$

$$= \max. [f(a), f(b), f(c)]$$

Least value of  $f(x)$  in interval  $[a, b]$

$$= \text{Min. } [f(a), f(b), f(c)]$$

Where  $x = c$  is a point such that  $f'(c) = 0$

## 6. Properties of Maxima & Minima

If  $f(x)$  is a continuous function and the graph of this function is drawn, then-

- (i) Between two equal values of  $f(x)$ , there lie at least one maxima or minima.
- (ii) Maxima and minima occur alternately. For example if  $x = -1, 0, 2, 3$  are extreme points of a continuous function and if  $x = 0$  is a maximum point then  $x = -1, 2$  will be minimum points.
- (iii) When  $x$  passes a maximum point, the sign of  $f'(x)$  changes from +ve to -ve, whereas  $x$  passes through a minimum point, the sign of  $f'(x)$  changes from -ve to +ve.
- (iv) If there is no change in the sign of  $dy/dx$  on two sides of a point, then such a point is not an extreme point.
- (v) If  $f(x)$  is a maximum (minimum) at a point  $x = a$ , then  $1/f(x)$ , [ $f(x) \neq 0$ ] will be minimum (maximum) at that point.
- (vi) If  $f(x)$  is maximum (minimum) at a point  $x = a$ , then for any  $\lambda \in \mathbb{R}$ ,  $\lambda + f(x)$ ,  $\log f(x)$  and for any  $k > 0$ ,  $k f(x)$ ,  $[f(x)]^k$  are also maximum (minimum) at that point.

## 7. Maxima & Minima of Functions of Two Variables

If a function is defined in terms of two variables and if these variables are associated with a given relation then by eliminating one variable, we convert function in terms of one variable and then find the maxima and minima by known methods.

## 8. Some Standard Geometrical Results Related to Maxima & Minima

The following results can easily be established.

- (i) The area of rectangle with given perimeter is greatest when it is a square.
- (ii) The perimeter of a rectangle with given area is least when it is a square.
- (iii) The greatest rectangle inscribed in a given circle is a square.
- (iv) The greatest triangle inscribed in a given circle is equilateral.

(v) The semi vertical angle of a cone with given slant height and maximum volume is  $\tan^{-1} \sqrt{2}$ .

(vi) The height of a cylinder of maximum volume inscribed in a sphere of radius a is  $2a/\sqrt{3}$ .

## 9. Some Important Results

(i) **Equilateral triangle :**

Area =  $(\sqrt{3}/4) x^2$ , where x is its side.

(ii) **Square :**

Area =  $a^2$ , perimeter =  $4a$ ,

where a is its side.

(iii) **Rectangle:**

Area =  $a b$ , perimeter =  $2 (a + b)$

where a, b are its sides

(iv) **Trapezium :**

Area =  $1/2 (a+ b) h$

Where a, b are lengths of parallel sides and h be the distance between them.

(v) **Circle :**

Area =  $\pi a^2$ , perimeter =  $2\pi a$ ,

where a is its radius.

(vi) **Sphere :**

Volume =  $4/3 \pi a^3$ , surface  $4\pi a^2$

where a is its radius

**(vii) Right Circular cone :**

$$\text{Volume} = \frac{1}{3} \pi r^2 h, \text{ curved surface} = \pi r \ell$$

Where  $r$  is the radius of its base,  $h$  be its height and  $\ell$  be its slant heights

**(viii) Cylinder :**

$$\text{Volume} = \pi r^2 h$$

$$\text{whole surface} = 2 \pi r (r + h)$$

where  $r$  is the radius of the base and  $h$  be its height.

## SOLVED EXAMPLES

**Ex.1**  $f(x) = 2x^3 - 21x^2 + 36x + 7$  has a maxima at -  
 (A)  $x = 2$  (B)  $x = 1$  (C)  $x = 6$  (D)  $x = 3$

**Sol.**  $f'(x) = 6x^2 - 42x + 36$   
 $f''(x) = 12x - 42$   
 Now  $f'(x) = 0 \Rightarrow 6(x^2 - 7x + 6) = 0$   
 $\Rightarrow x = 1, 6$   
 Also  $f''(1) = 12 - 42 = -30 < 0$   
 $\therefore f(x)$  has a maxima at  $x = 1$

**Ans.[B]**

**Ex.2** The minimum value of the function  $x^x (x > 0)$  is at -  
 (A)  $x = 1$  (B)  $x = e$   
 (C)  $x = e^{-1}$  (D) None of these

**Sol.** Let  $y = x^x \Rightarrow \log y = x \log x$   
 $\Rightarrow \frac{d}{dx} (\log y) = 1 + \log x$   
 and  $\frac{d^2}{dx^2} (\log y) = \frac{1}{x} = x^{-1}$

Now for minimum value of  $y$  or  $\log y$

$$\frac{d}{dx} (\log y) = 0 \Rightarrow 1 + \log x = 0$$

$$\Rightarrow x = e^{-1} \text{ Again for } x = e^{-1}$$

$$\frac{d^2}{dx^2} (\log y) = e > 0$$

$$\Rightarrow y \text{ is minimum at } x = e^{-1}$$

**Ans.[C]**

**Ex.3** If  $x = p$  and  $x = q$  are respectively the maximum and minimum points of the function  $x^5 - 5x^4 + 5x^3 - 10$ , then -

(A)  $p = 0, q = 1$  (B)  $p = 1, q = 0$   
 (C)  $p = 1, q = 3$  (D)  $p = 3, q = 1$

**Sol.** Let  $f(x) = x^5 - 5x^4 + 5x^3 - 10$ , then  
 $f'(x) = 5x^4 - 20x^3 + 15x^2$   
 $= 5x^2(x-1)(x-3)$

$$\text{and } f''(x) = 20x^3 - 60x^2 + 30x$$

For maxima and minima

$$f'(x) = 0 \Rightarrow 5x^2(x-1)(x-3) = 0$$

$$\Rightarrow x = 0, 1, 3 \text{ Also } f''(1) = -10 < 0$$

$\Rightarrow x = 1$  is a point of maxima  $\Rightarrow p = 1$   
 and  $f''(3) = 90 > 0$   
 $\Rightarrow x = 3$  is a point of minima  $\Rightarrow q = 3$ .

**Ans.[C]**

**Ex.4** Let  $x, y$  be two variables and  $x > 0, xy = 1$ . Then minimum value of  $x + y$  is -  
 (A) 1 (B) 2 (C) 3  
 (D) 4

**Sol.** Let  $A = x + y = x + 1/x (\because xy = 1)$

$$\Rightarrow \frac{dA}{dx} = 1 - \frac{1}{x^2}, \frac{d^2A}{dx^2} = \frac{2}{x^3}$$

$$\text{Now } \frac{dA}{dx} = 0 \Rightarrow x = 1, -1$$

$$\text{Also at } x = 1, \frac{d^2A}{dx^2} = 2 > 0$$

$x = 1$  is a minimum point of  $A$ . So minimum value of  $A = 1 + 1/1 = 2$ .

**Ans.[B]**

**Ex.5** The maximum value of function  $\sin x (1 + \cos x)$  occurs at -

(A)  $x = \pi/4$  (B)  $x = \pi/2$   
 (C)  $x = \pi/3$  (D)  $x = \pi/6$

**Sol.** Let  $f(x) = \sin x (1 + \cos x) = \sin x + \frac{1}{2} \sin 2x$ ,

$$\text{then } f'(x) = \cos x + \cos 2x$$

$$\text{and } f''(x) = -\sin x - 2 \sin 2x$$

For maximum value  $f'(x) = 0$

$$\Rightarrow \cos x + \cos 2x = 0$$

$$\Rightarrow \cos x = -\cos 2x$$

$$\Rightarrow \cos x = \cos(\pi - 2x)$$

$$\Rightarrow x = \pi - 2x \Rightarrow x = \pi/3$$

Again  $f''(\pi/3) = -\sin(\pi/3) - 2 \sin(2\pi/3)$

$$= -\frac{3\sqrt{3}}{2} < 0$$

$\Rightarrow$  Maximum value of function occurs at  $x = \pi/3$

**Ans.[C]**

**Ex.6** The maximum value of  $3 \sin x + 4 \cos x$  is -

- (A) 3 (B) 4 (D) 5  
(D) 7

**Sol.** Let  $f(x) = 3 \sin x + 4 \cos x$

$$\Rightarrow f'(x) = 3 \cos x - 4 \sin x$$

$$f''(x) = -3 \sin x - 4 \cos x$$

$$\text{Now } f'(x) = 0 \Rightarrow 3 \cos x - 4 \sin x = 0$$

$$\Rightarrow \tan x = 3/4$$

Also then  $\sin x = 3/5$ ,  $\cos x = 4/5$  and so at

$$x = \tan^{-1}(3/4)$$

$$f''(x) = -3(3/5) - 4(4/5) < 0$$

$\Rightarrow f(x)$  has a maxima at  $\tan x = 3/4$ . Also its maximum value

$$= 3(3/5) + 4(4/5) = 5$$

**Ans.[C]**

**Ex.7** If  $x = -1$  and  $x = 2$  are extreme points of the function  $y = a \log x + bx^2 + x$ , then-

- (A)  $a = 2$ ,  $b = 1/2$  (B)  $a = 2$ ,  $b = -1/2$   
(C)  $a = -2$ ,  $b = 1/2$  (D)  $a = -2$ ,  $b = -1/2$

**Sol.**  $\frac{dy}{dx} = \frac{a}{x} + 2bx + 1$

Since  $x = -1$  and  $x = 2$  are extreme points so  $dy/dx$  at these points must be zero. So

$$-a - 2b + 1 = 0 \text{ and } a/2 + 4b + 1 = 0$$

$$\Rightarrow a + 2b - 1 = 0 \text{ and } a + 8b + 2 = 0$$

$$\Rightarrow a = 2, b = -1/2$$

**Ans.[B]**

**Ex.8** In  $[0, 2\pi]$  one maximum value of  $x + \sin 2x$  is -

- (A)  $\frac{2\pi}{3} + \frac{\sqrt{3}}{2}$  (B)  $\frac{2\pi}{3} - \frac{\sqrt{3}}{2}$   
(C)  $\frac{\pi}{3} + \frac{\sqrt{3}}{2}$  (D)  $\frac{\pi}{3} - \frac{\sqrt{3}}{2}$

**Sol.** Let  $f(x) = x + \sin 2x$

$$\Rightarrow f'(x) = 1 + 2 \cos 2x$$

$$f''(x) = -4 \sin 2x$$

$$\text{Now } f'(x) = 0 \Rightarrow \cos 2x = -1/2$$

$$\Rightarrow 2x = 2\pi/3, 4\pi/3, \dots$$

$$\Rightarrow x = \pi/3, 2\pi/3$$

$$\text{But } f''(\pi/3) = -4(\sqrt{3}/2) < 0$$

$\therefore f(x)$  is maximum at  $x = \pi/3$  and its one maximum value

$$= \pi/3 + \sin(2\pi/3)$$

$$= \pi/3 + \sqrt{3}/2$$

**Ans.[C]**

**Ex.9** The maximum and minimum values of  $\sin 2x - x$  are-

- (A) 1, -1 (B)  $\frac{3\sqrt{3}-\pi}{6}, \frac{\pi-3\sqrt{3}}{6}$   
(C)  $\frac{\pi-3\sqrt{3}}{6}, \frac{3\sqrt{3}-\pi}{6}$  (D) Do not exist

**Sol.**  $f(x) = \sin 2x - x$

$$f'(x) = 2 \cos 2x - 1$$

$$f''(x) = -4 \sin 2x$$

$$\text{Now } f'(x) = 0 \Rightarrow 2 \cos 2x - 1 = 0$$

$$\Rightarrow x = n\pi \pm \pi/6 \quad n = 0, 1, 2, \dots$$

$$\Rightarrow x = \pi/6, 5\pi/6, 7\pi/6, -\pi/6, \dots$$

$$\text{But } f''(\pi/6) = -2\sqrt{3} < 0$$

$$\Rightarrow x = \pi/6 \text{ is a max. point}$$

$$\text{Also } f''(5\pi/6) = 2\sqrt{3} > 0$$

$$\Rightarrow x = 5\pi/6 \text{ is a min. point}$$

$$\text{Hence one max. value} = f(\pi/6) = \frac{3\sqrt{3}-\pi}{6}$$

$$\text{one min. value} = f(5\pi/6) = -\frac{3\sqrt{3}-5\pi}{6}$$

But it is not there in given alternatives. Hence by alternate position another min. point is  $-\pi/6$  so one min. value

$$= f(-\pi/6) = \frac{\pi-3\sqrt{3}}{6}$$

**Ans.[B]**

**Ex.10** For what values of  $x$ , the function  $\sin x + \cos 2x$  ( $x > 0$ ) is minimum -

- (A)  $\frac{n\pi}{2}$  (B)  $\frac{3(n+1)\pi}{2}$

- (C)  $\frac{(2n+1)\pi}{2}$  (D) None of these

**Sol.** Let  $f(x) = \sin x + \cos 2x$ , then

$$f'(x) = \cos x - 2 \sin 2x$$

$$\text{and } f''(x) = -\sin x - 4 \cos 2x$$

$$\text{For minimum } f'(x) = 0 \Rightarrow \cos x - 4 \sin x \cos x = 0$$

$$\Rightarrow \cos x (1 - 4 \sin x) = 0$$

$$\Rightarrow \cos x = 0 \text{ or } 1 - 4 \sin x = 0 \Rightarrow x = (2n + 1) \pi/2 \text{ or}$$

$$x = n\pi + (-1)^n \sin^{-1} \left( \frac{1}{4} \right), n \in \mathbb{Z}$$

$$\text{Now } f'' \left\{ (2n+1) \frac{\pi}{2} \right\}$$

$$= -\sin \left\{ (2n+1) \frac{\pi}{2} \right\} - 4 \cos (2n+1) \pi$$

$$= -(-1)^n - 4(-1)^{2n+1} > 0$$

$$\text{The function is minimum at } x = \frac{(2n+1)\pi}{2}$$

**Ans.[C]**

**Ex.11** The minimum value of

$64 \sec x + 27 \operatorname{cosec} x$ ,  $0 < x < \pi/2$  is-

- (A) 91 (B) 25  
(C) 125 (D) None of these

**Sol.** Let  $y = 64 \sec x + 27 \operatorname{cosec} x$

$$\Rightarrow \frac{dy}{dx} = 64 \sec x \tan x - 27 \operatorname{cosec} x \cot x$$

$$\frac{d^2y}{dx^2} = 64 \sec^3 x + 64 \sec x \tan^2 x + 27 \operatorname{cosec}^3 x + 27 \operatorname{cosec} x \cot^2 x$$

$$\text{Now } \frac{dy}{dx} = 0 \Rightarrow 64 \sec x \tan x = 27 \operatorname{cosec} x \cot x$$

$$\Rightarrow \tan^3 x = 27/64$$

$$\Rightarrow \tan x = 3/4$$

$$\text{Also then } \frac{d^2y}{dx^2} > 0 \quad (\because 0 < x < \pi/2)$$

So  $y$  is minimum when

$x = \tan^{-1} (3/4)$  and its

$$\text{min. value} = 64 (5/4) + 27 (5/3) = 125$$

**Ans.[C]**

**Ex.12** If  $0 \leq c \leq 5$ , then the minimum distance of the point  $(0, c)$  from parabola  $y = x^2$  is-

- (A)  $\sqrt{c-4}$  (B)  $\sqrt{c-1/4}$   
(C)  $\sqrt{c+1/4}$  (D) None of these

**Sol.** Let  $(\sqrt{t}, t)$  be a point on the parabola whose distance from  $(0, c)$ , be  $d$ . Then

$$z = d^2 = t + (t-c)^2 = t^2 + t(1-2c) + c^2$$

$$\Rightarrow \frac{dz}{dt} = 2t + 1 - 2c, \frac{d^2z}{dt^2} = 2 > 0$$

$$\text{Now } \frac{dz}{dt} = 0 \Rightarrow t = c - 1/2$$

which gives the minimum distance. So

$$\begin{aligned} \text{min. distance} &= \sqrt{(c-1/2) + (-1/2)^2} \\ &= \sqrt{c-1/4} \end{aligned}$$

**Ans.[B]**

**Ex.13** The minimum value of the function

$$\frac{40}{3x^4 + 8x^3 - 18x^2 + 60} \text{ is -}$$

- (A) 2/3 (B) 3/2  
(C) 40/53 (D) None of these

**Sol.** Let  $y = \frac{1}{40} (3x^4 + 8x^3 - 18x^2 + 60)$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{40} (12x^3 + 24x^2 - 36x)$$

$$\text{and } \frac{d^2y}{dx^2} = \frac{1}{40} (36x^2 + 48x - 36)$$

$$\text{Now } \frac{dy}{dx} = 0 \Rightarrow x^3 + 2x^2 - 3x = 0$$

$$\text{or } x(x-1)(x+3) = 0$$

$$\text{or } x = 0, 1, -3$$

$$\text{At } x = 0, \frac{d^2y}{dx^2} = -36 < 0$$

$\therefore y$  is maximum at  $x = 0$

$\Rightarrow$  the given function i.e.  $1/y$  is minimum at  $x = 0$

$\therefore$  minimum value of the function

$$\frac{40}{60} = \frac{2}{3}$$

**Ans.[A]**

**Ex.14** If  $\frac{dy}{dx} = (x-1)^3 (x-2)^4$ , then  $y$  is -

- (A) maximum at  $x = 1$   
(B) maximum at  $x = 2$   
(C) minimum at  $x = 1$   
(D) minimum at  $x = 2$

**Sol.**  $\frac{dy}{dx} = 0 \Rightarrow x = 1, 2$ . If  $h > 0$  is very small number, then

$$\text{at } x = 1-h, \frac{dy}{dx} = (-)(+) = -ve$$

$$x = 1+h, \frac{dy}{dx} = (+)(+) = +ve$$

at  $x = 1$ ,  $\frac{dy}{dx}$  changes its sign from -ve to +ve which shows that  $x = 1$  is a minimum.

**Ans.[C]**

**Ex.15** The maximum area of a rectangle of perimeter 176 cms. is -

- (A) 1936 sq.cms.      (B) 1854 sq.cms.  
(C) 2110 sq.cms.      (D) None of these

**Sol.** Let sides of the rectangle be  $x, y$ ; then

$$2x + 2y = 176 \quad \dots(1)$$

$$\therefore \text{Its area } A = xy = x(88 - x)$$

$$[\text{form (1)}] = 88x - x^2$$

$$\Rightarrow \frac{dA}{dx} = 88 - 2x, \quad \frac{d^2A}{dx^2} = -2 < 0$$

$$\text{Now } \frac{dA}{dx} = 0 \Rightarrow x = 44;$$

Also then  $\frac{d^2A}{dx^2} < 0$ . So area will be maximum when  $x = 44$  and maximum area =  $44 \times 44 = 1936$  sq. cms.

**Ans.[A]**

**Ex.16** The semivertical angle of a right circular cone of given slant height and maximum volume is-

- (A)  $\tan^{-1} 2$       (B)  $\tan^{-1} (\sqrt{2})$   
(C)  $\tan^{-1} \left(\frac{1}{2}\right)$       (D)  $\tan^{-1} \left(\frac{1}{\sqrt{2}}\right)$

**Sol.** Let  $\ell$  be the slant height and  $\alpha$  be the semivertical angle of the right circular cone.

Also suppose that  $h$  and  $r$  are its height and radius of the base.

Then  $h = \ell \cos \alpha$ ,  $r = \ell \sin \alpha$

$$\text{Now volume } V = \frac{1}{3} \pi r^2 h$$

$$= \frac{1}{3} \pi \ell^3 \sin^2 \alpha \cos \alpha$$

$$\therefore \frac{dV}{d\alpha} = \frac{1}{3} \pi \ell^3 [-\sin^3 \alpha + 2 \sin \alpha \cos^2 \alpha]$$

$$= \frac{1}{3} \pi \ell^3 [-\sin^3 \alpha + 2 \sin \alpha (1 - \sin^2 \alpha)]$$

$$= \frac{1}{3} \pi \ell^3 [2 \sin \alpha - 3 \sin^3 \alpha]$$

$$\therefore \frac{d^2V}{d\alpha^2} = \frac{1}{3} \pi \ell^3 [2 \cos \alpha - 9 \sin^2 \alpha \cos \alpha]$$

$$\text{Now } \frac{dV}{d\alpha} = 0 \Rightarrow \sin \alpha = 0 \text{ or } 2 - 3 \sin^2 \alpha = 0$$

$$\text{Now } \alpha \neq 0 \therefore 2 = 3 \sin^2 \alpha$$

$$\text{or } 2 \sin^2 \alpha + 2 \cos^2 \alpha = 3 \sin^2 \alpha$$

$$\text{or } \tan^2 \alpha = 2 \Rightarrow \tan \alpha = \sqrt{2}$$

$$\text{When } \tan \alpha = \sqrt{2}, \quad \frac{d^2V}{d\alpha^2} < 0$$

Thus when  $\alpha = \tan^{-1} \sqrt{2}$ , volume will be maximum. **Ans. [B]**

**Ex.17** Two parts of 10 such that the sum of the twice of first with the square of second is minimum, are-

- (A) 9, 1      (B) 5, 5      (C) 4, 6      (D) 1, 9

**Sol.** Let two parts be  $x$  and  $(10-x)$ . If

$$y = 2x + (10-x)^2$$

$$\text{Then } \frac{dy}{dx} = 2 - 2(10-x) = 2x - 18$$

$$\text{Now } \frac{dy}{dx} = 0 \Rightarrow x = 9$$

Also then  $\frac{d^2y}{dx^2} = 2 > 0$ . Hence when  $x = 9$ , value of  $y$  is minimum. So required two parts of 10 are 9 and 1. **Ans.[A]**

- Ex.18** For the curve  $y = xe^x -$   
 (A)  $x = 0$  is a point of maxima  
 (B)  $x = 0$  is a point of minima  
 (C)  $x = -1$  is a point of minima  
 (D)  $x = -1$  is a point of maxima

**Sol.**  $y = xe^x \Rightarrow \frac{dy}{dx} = xe^x + e^x$

and  $\frac{d^2y}{dx^2} = xe^x + 2e^x$

now  $\frac{dy}{dx} = 0 \Rightarrow e^x(x+1) = 0$

$\Rightarrow x = -1 \quad [\because e^x > 0, \forall x]$

and at  $x = -1, \frac{d^2y}{dx^2} = e^{-x}(-1+2) > 0$

Therefore  $x = -1$  is a point of minima.

**Ans.[C]**

- Ex.19** If  $\sin x - x \cos x$  is maximum at  $x = n\pi$ , then-  
 (A)  $n$  is an odd positive integer  
 (B)  $n$  is an even negative integer  
 (C)  $n$  is an even positive integer  
 (D)  $n$  is an odd positive or even negative integer

**Sol.** Let  $f(x) = \sin x - x \cos x$ , then  
 $\Rightarrow f'(x) = \cos x - \cos x + x \sin x = x \sin x$   
 $f''(x) = x \cos x - \sin x$

Now  $f'(x) = 0 \Rightarrow x \sin x = 0$

$\Rightarrow x = 0, n\pi \quad n = 0, 1, 2, \dots$

Also  $f''(n\pi) = n\pi \cos n\pi - \sin n\pi$   
 $= (-1)^n n\pi$

But  $f(x)$  is maximum at  $x = n\pi$  when  $f''(n\pi) < 0$

$\Rightarrow (-1)^n n\pi < 0 \Rightarrow (-1)^n n < 0$

$\Rightarrow$  either  $n$  is an odd positive or even negative integer.

**Ans.[D]**

**Ex.20**  $x(1-x^2), 0 \leq x \leq 2$  is maximum at -

- (A)  $x = 0$  (B)  $x = 1$   
 (C)  $x = 1/\sqrt{3}$  (D) Nowhere

**Sol.** Let  $y = x(1-x^2)$

$\Rightarrow \frac{dy}{dx} = (1-x^2) - 2x^2 = 1 - 3x^2$

and  $\frac{d^2y}{dx^2} = -6x$

Now  $dy/dx = 0 \Rightarrow x = \pm \frac{1}{\sqrt{3}}$

Now at  $x = \frac{1}{\sqrt{3}}, \frac{d^2y}{dx^2} < 0$ .

Therefore  $y$  is maximum at  $x = \frac{1}{\sqrt{3}}$

**Ans.[C]**

**Ex.21** A curve whose slope at  $(x,y)$  is  $x^2 - 2x$ , passes through the point  $(2,0)$ . The point with greatest ordinate on the curve is-

- (A)  $(0, 0)$  (B)  $(0, 4)$   
 (C)  $(0, 4/3)$  (D)  $(0, 3/4)$

**Sol.** Here  $\frac{dy}{dx} = x^2 - 2x$

$\Rightarrow y = \frac{1}{3}x^3 - x^2 + c$

Since the curve passes through the point  $(2,0)$ , therefore

$0 = (8/3) - 4 + c \Rightarrow c = 4/3$

$\therefore$  equation of curve  $y = \frac{1}{3}x^3 - x^2 + \frac{4}{3}$  and

$\frac{dy}{dx} = x^2 - 2x, \frac{d^2y}{dx^2} = 2x - 2$

Now  $\frac{dy}{dx} = 0 \Rightarrow x = 0, 2$

But at  $x = 0, \frac{d^2y}{dx^2} = -2 < 0$

Thus at  $x = 0, y = 4/3$  is maximum.

**Ans.[C]**

**Ex.22**  $f(x) = 1 + 2 \sin x + 3 \cos^2 x$  ( $0 \leq x \leq 2\pi/3$ ) is-

- (A) minimum at  $x = \pi/2$   
 (B) maximum at  $x = \sin^{-1}(1/\sqrt{3})$   
 (C) minimum at  $x = \pi/3$   
 (D) minimum at  $x = \sin^{-1}(1/3)$

**Sol.**  $f'(x) = 2 \cos x - 6 \cos x \sin x$

$f''(x) = -2 \sin x + 6 \sin^2 x - 6 \cos^2 x$   
 $= -2 \sin x + 12 \sin^2 x - 6$

Now  $f'(x) = 0 \Rightarrow \cos x = 0$  and  $\sin x = 1/3$

or  $x = \pi/2$  &  $x = \sin^{-1}(1/3)$

so  $f''(\pi/2) = -2 + 12 - 6 > 0$

$$f'' \left( \sin^{-1} \frac{1}{3} \right) = \frac{-2}{3} + \frac{4}{3} - 6 < 0$$

$\therefore f(x)$  is minimum at  $x = \pi/2$ .

**Ans.[A]**

**Ex.23** The minimum value of  $e^{(2x^2-2x-1)\sin^2 x}$  is -

- (A) e      (B) 1/e      (C) 1  
(D) 0

**Sol.** Let  $y = e^{(2x^2-2x-1)\sin^2 x}$

$$\text{and } u = (2x^2 - 2x - 1) \sin^2 x$$

$$\text{Now } \frac{du}{dx}$$

$$= (2x^2 - 2x - 1) 2 \sin x \cos x + (4x - 2) \sin^2 x$$

$$= \sin x [2(2x^2 - 2x) \cos x + (4x - 2) \sin x]$$

$$\frac{du}{dx} = 0 \Rightarrow \sin x = 0 \Rightarrow x = n\pi$$

$$\frac{d^2u}{dx^2} = \sin x \frac{d}{dx} [2(2x^2 - 2x - 1) \cos x$$

$$+ (4x - 2) \sin x] + \cos x [2 \cos x (2x^2 - 2x - 1)$$

$$+ (4x - 2) \sin x]$$

At  $x = n\pi$ ,

$$\frac{d^2u}{dx^2} = 0 + 2 \cos^2 n\pi (2n^2 \pi^2 - 2n\pi - 1) > 0$$

Hence at  $x = n\pi$ , the value of  $u$  and so its corresponding the value of  $y$  is minimum and minimum value =  $e^0 = 1$ .

**Ans.[C]**
