

HYPERBOLA

(KEY CONCEPTS + SOLVED EXAMPLES)

HYPERBOLA

1. *Standard equation and definitions*
2. *Conjugate Hyperbola*
3. *Parametric equation of the Hyperbola*
4. *Position of a point $P(x_1, y_1)$ with respect to Hyperbola*
5. *Line and Hyperbola*
6. *Equation of the Tangent*

KEY CONCEPTS

1. Standard Equation and Definitions

Standard Equation of hyperbola is $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

(i) Definition hyperbola :

A **Hyperbola** is the locus of a point in a plane which moves in the plane in such a way that the ratio of its distance from a fixed point (called focus) in the same plane to its distance from a fixed line (called directrix) is always constant which is always greater than unity.

$$e = \sqrt{1 + \left(\frac{2b}{2a}\right)^2} = \sqrt{1 + \left(\frac{\text{Conjugate axes}}{\text{Transverse axes}}\right)^2}$$

(ii) Vertices :

The point A and A' where the curve meets the line joining the foci S and S' are called vertices of hyperbola.

(vi) Focal distance :

The distance of any point on the hyperbola from the focus is called the focal distance of the point.

(iii) Transverse and Conjugate axes :

The straight line joining the vertices A and A' is called transverse axes of the hyperbola. Straight line perpendicular to the transverse axes and passes through its centre called conjugate axes.

Note : The difference of the focal distance of a point on the hyperbola is constant and is equal to the length of the transverse axes. $|S'P - SP| = 2a$ (const.)

(iv) Latus Rectum :

The chord of the hyperbola which passes through the focus and is perpendicular to its transverse axes is called latus rectum. Length of latus rectum = $\frac{2b^2}{a}$.

2. Conjugate Hyperbola

The hyperbola whose transverse and conjugate axes are respectively the conjugate and transverse axes of a given hyperbola is called conjugate hyperbola.

$$\text{Equation of conjugate hyperbola} - \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

(v) Eccentricity :

For the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, $b^2 = a^2(e^2 - 1)$

Note :

- (i) If e_1 and e_2 are the eccentricities of the hyperbola and its conjugate then $\frac{1}{e_1^2} + \frac{1}{e_2^2} = 1$
- (ii) The focus of hyperbola and its conjugate are concyclic.

S.No.	Particulars	Hyperbola	Conjugate Hyperbola
		$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$	$-\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$
1.	Co-ordinate of the centre	(0, 0)	(0, 0)
2.	Co-ordinate of the vertices	(a, 0) & (-a, 0)	(0, b) & (0, -b)
3.	Co-ordinate of foci	(± ae, 0)	(0, ± be)
4.	Length of the transverse axes	2a	2b
5.	Length of the conjugate axes	2b	2a
6.	Equation of directrix	$x = \pm a/e$	$y = \pm b/e$
7.	Eccentricity	$e = \sqrt{1 + \frac{b^2}{a^2}}$	$e = \sqrt{1 + \frac{a^2}{b^2}}$
8.	Length of latus rectum	$\frac{2b^2}{a}$	$\frac{2a^2}{b}$
9.	Equation of transverse axes	$y = 0$	$x = 0$
10.	Equation of conjugate axes	$x = 0$	$y = 0$

3. Parametric equation of the Hyperbola

Let the equation of ellipse in standard form will be given by $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

Then the equation of ellipse in the parametric form will be given by $x = a \sec \phi$, $y = b \tan \phi$ where ϕ is the eccentric angle whose value vary from $0 \leq \phi < 2\pi$. Therefore coordinate of any point P on the ellipse will be given by $(a \sec \phi, b \tan \phi)$.

4. Position of a point P(x₁, y₁) with respect to Hyperbola

The quantity $\frac{x_1^2}{a^2} - \frac{y_1^2}{b^2} = 1$ is positive, zero or negative according as the point (x_1, y_1) lies inside on or outside the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$.

5. Line and Hyperbola

“The straight line $y = mx + c$ is a secant, a tangent or passes outside the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ according as $c^2 > = < a^2m^2 - b^2$

6. Equation of Tangent

(i) The equation of tangents of slope m to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ are $y = mx \pm \sqrt{a^2m^2 - b^2}$ and the co-ordinates of the point of contacts are

$$\left(\pm \frac{a^2m}{\sqrt{a^2m^2 - b^2}}, \pm \frac{b^2}{\sqrt{a^2m^2 - b^2}} \right)$$

(ii) Equation of tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

$$\text{at the point } (x_1, y_1) \text{ is } \frac{xx_1}{a^2} - \frac{yy_1}{b^2} = 1$$

(iii) Equation of tangent to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$

$$\text{at the point } (a \sec \theta, b \tan \theta) \text{ is } \frac{x}{a} \sec \theta - \frac{y}{b} \tan \theta = 1$$

Note : In general two tangents can be drawn from an external point (x_1, y_1) to the hyperbola and they are $y - y_1 = m_1(x - x_1)$ and $y - y_1 = m_2(x - x_1)$, where m_1 and m_2 are roots of

$$(x_1^2 - a^2)m^2 - 2x_1y_1m + y_1^2 + b^2 = 0$$

SOLVED EXAMPLES

Ex.1 Find the equation of the hyperbola whose directrix is $2x + y = 1$, focus $(1, 2)$ and eccentricity $\sqrt{3}$.

Sol. Let $P(x, y)$ be any point on the hyperbola. Draw PM perpendicular from P on the directrix.

Then by definition

$$SP = e PM$$

$$\Rightarrow (SP)^2 = e^2(PM)^2$$

$$\Rightarrow (x-1)^2 + (y-2)^2 = 3 \left\{ \frac{2x+y-1}{\sqrt{4+1}} \right\}^2$$

$$\Rightarrow 5(x^2 + y^2 - 2x - 4y + 5) = 3(4x^2 + y^2 + 1 + 4xy - 2y - 4x)$$

$$\Rightarrow 7x^2 - 2y^2 + 12xy - 2x + 14y - 22 = 0$$

which is the required hyperbola.

Ex.2 Find the lengths of transverse axis and conjugate axis, eccentricity and the co-ordinates of foci and vertices; lengths of the latus rectum, equations of the directrices of the hyperbola $16x^2 - 9y^2 = -144$.

Sol. The equation $16x^2 - 9y^2 = -144$ can be written as

$$\frac{x^2}{9} - \frac{y^2}{16} = -1. \text{ This is of the form}$$

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = -1$$

$$\therefore a^2 = 9, b^2 = 16 \Rightarrow a = 3, b = 4$$

Length of transverse axis :

$$\text{The length of transverse axis} = 2b = 8$$

Length of conjugate axis :

$$\text{The length of conjugate axis} = 2a = 6$$

$$\text{Eccentricity : } e = \sqrt{1 + \frac{a^2}{b^2}} = \sqrt{1 + \frac{9}{16}} = \frac{5}{4}$$

Foci : the co-ordinates of the foci are $(0, \pm be)$, i.e., $(0, \pm 4)$

Length of Latus rectum :

$$\text{The length of latus rectum} = \frac{2a^2}{b} = \frac{2(3)^2}{4} = \frac{9}{2}$$

Equation of directrices :

$$\text{The equation of directrices are } y = \pm \frac{b}{e}$$

$$y = \pm \frac{4}{(5/4)} = \pm \frac{16}{5}$$

Ex.3 Find the position of the point $(5, -4)$ relative to the hyperbola $9x^2 - y^2 = 1$.

Sol. Since $9(5)^2 - (-4)^2 - 1 = 225 - 16 - 1 = 208 > 0$ so the point $(5, -4)$ lies outside the hyperbola $9x^2 - y^2 = 1$

Ex.4 The line $5x + 12y = 9$ touches the hyperbola $x^2 - 9y^2 = 9$ at the point

(A) $(-5, 4/3)$

(B) $(5, -4/3)$

(C) $(3, -1/2)$

(D) None of these

Sol.[B] We have : $m = \text{Slope of the tangent} = -\frac{5}{12}$

If a line of slope m is tangent to the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1, \text{ then the coordinates of the point of}$$

contact are

$$\left(\pm \frac{a^2 m}{\sqrt{a^2 m^2 - b^2}}, \pm \frac{b^2}{\sqrt{a^2 m^2 - b^2}} \right)$$

$$\text{Here, } a^2 = 9, b^2 = 1 \text{ and } m = -5/12$$

$$\text{So, points of contact are } \left(\pm 5, \pm \frac{4}{3} \right)$$

$$\text{i.e. } \left(-5, \frac{4}{3} \right) \text{ and } \left(5, -\frac{4}{3} \right).$$

Out of these two points $\left(5, -\frac{4}{3} \right)$ lies on the line

$5x + 12y = 9$. Hence, $\left(5, -\frac{4}{3} \right)$ is the required point.

Ex. 5 The equation of the common tangents to the parabola $y^2 = 8x$ and the hyperbola $3x^2 - y^2 = 3$ is -

- (A) $2x \pm y + 1 = 0$ (B) $x \pm y + 1 = 0$
 (C) $x \pm 2y + 1 = 0$ (D) $x \pm y + 2 = 0$

Sol.[A] Parabola $y^2 = 8x$

$$\therefore 4a = 8 \Rightarrow a = 2$$

Any tangent to the parabola is

$$y = mx + \frac{2}{m} \quad \dots(i)$$

If it is also tangent to the hyperbola

$$\frac{x^2}{1} - \frac{y^2}{3} = 1 \text{ i.e. } a^2 = 1, b^2 = 3 \text{ then}$$

$$c^2 = a^2m^2 - b^2 \Rightarrow \left(\frac{2}{m}\right)^2 = 1 \cdot m^2 - 3$$

$$\text{or } m^4 - 3m^2 - 4 = 0 \Rightarrow (m^2 - 4)(m^2 + 1) = 0$$

$\therefore m = \pm 2$ putting for m in (i), we get the tangents as $2x \pm y + 1 = 0$

Ex. 6 The locus of the point of intersection of the lines

$$\sqrt{3}x - y - 4\sqrt{3}k = 0 \text{ and}$$

$$\sqrt{3}kx + ky - 4\sqrt{3} = 0 \text{ for different values of } k \text{ is -}$$

- (A) Ellipse
 (B) Parabola
 (C) Circle
 (D) Hyperbola

Sol.[D] $\sqrt{3}x - y = 4\sqrt{3}k \quad \dots(i)$

$$\text{and } \sqrt{3}kx + ky - 4\sqrt{3} = 0$$

$$\Rightarrow k(\sqrt{3}x + y) = 4\sqrt{3} \quad \dots(ii)$$

To find the locus of their point of intersection eliminate the variable K between the equations

from (i) $K = \frac{\sqrt{3}x - y}{4\sqrt{3}}$ and putting in (ii), we get

$$(\sqrt{3}x - y)(\sqrt{3}x + y) = (4\sqrt{3})^2$$

$$3x^2 - y^2 = 48$$

$$\text{or } \frac{x^2}{16} - \frac{y^2}{48} = 1$$

Hence the locus is hyperbola

Ex. 7 The eccentricity of the conic represented by $x^2 - y^2 - 4x + 4y + 16 = 0$ is -

- (A) 1 (B) $\sqrt{2}$
 (C) 2 (D) $\frac{1}{2}$

Sol.[B] We have $x^2 - y^2 - 4x + 4y + 16 = 0$

$$\text{or } (x^2 - 4x) - (y^2 - 4y) = -16$$

$$\text{or } (x^2 - 4x + 4) - (y^2 - 4y + 4) = -16$$

$$\text{or } (x - 2)^2 - (y - 2)^2 = -16$$

$$\text{or } \frac{(x - 2)^2}{4^2} - \frac{(y - 2)^2}{4^2} = -1$$

i.e. $e^2 = 1 + \frac{a^2}{b^2}$ (\because conjugate hyperbola)

$$e^2 = 1 + \frac{4^2}{4^2} \Rightarrow e = \sqrt{2}$$

Ex. 8 The equation $9x^2 - 16y^2 - 18x + 32y - 151 = 0$ represent a hyperbola -

- (A) The length of the transverse axes is 4
 (B) Length of latus rectum is 9
 (C) Equation of directrix is $x = \frac{21}{5}$ and $x = -\frac{11}{5}$
 (D) None of these

Sol.[C] We have $9x^2 - 16y^2 - 18x + 32y - 151 = 0$

$$9(x^2 - 2x) - 16(y^2 - 2y) = 151$$

$$9(x^2 - 2x + 1) - 16(y^2 - 2y + 1) = 144$$

$$9(x - 1)^2 - 16(y - 1)^2 = 144$$

$$\frac{(x - 1)^2}{16} - \frac{(y - 1)^2}{9} = 1$$

$$\text{Comparing with } \frac{X^2}{a^2} - \frac{Y^2}{b^2} = 1$$

$$\text{where } X = x - 1, Y = y - 1$$

$$\text{and } a^2 = 16, b^2 = 9 \text{ so}$$

$$\text{The length of the transverse axes} = 2a = 8$$

$$\text{The length of the latus rectum} = \frac{2b^2}{a} = \frac{9}{2}$$

$$\text{The equation of the directrix } X = \pm \frac{a}{e}$$

$$x - 1 = \pm \frac{16}{5} \Rightarrow x = \pm \frac{16}{5} + 1$$

$$x = \frac{21}{5}; x = -\frac{11}{5}$$

Ex.9 For what value of λ does the line $y = 2x + \lambda$ touches the hyperbola $16x^2 - 9y^2 = 144$?

Sol. \therefore Equation of hyperbola is $16x^2 - 9y^2 = 144$

or $\frac{x^2}{9} - \frac{y^2}{16} = 1$ comparing this with

$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$, we get $a^2 = 9$, $b^2 = 16$ and

comparing this line $y = 2x + \lambda$ with $y = mx + c$;

$m = 2$ & $c = \lambda$

If the line $y = 2x + \lambda$ touches the hyperbola

$$16x^2 - 9y^2 = 144$$

then $c^2 = a^2m^2 - b^2 \Rightarrow \lambda = 9(2)^2 - 16$

$$\therefore \lambda = \pm 2\sqrt{5}$$

Ex.10 Find the equation of the tangent to the hyperbola $x^2 - 4y^2 = 36$ which is perpendicular to the line $x - y + 4 = 0$.

Sol. Let m be the slope of the tangent since the tangent is perpendicular to the line $x - y + 4 = 0$.

$$\therefore m \times 1 = -1 \quad \Rightarrow m = -1$$

since $x^2 - 4y^2 = 36$

$$\text{or } \frac{x^2}{36} - \frac{y^2}{9} = 1$$

Comparing this with $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$;

$\therefore a^2 = 36$ & $b^2 = 9$ so the equation of tangents are

$$y = (-1)x \pm \sqrt{36x(-1)^2 - 9}$$

$$\Rightarrow y = -x \pm \sqrt{27} \text{ or } x + y \pm 3\sqrt{3} = 0$$
